22 December 1983

Dear Mr. Fabris,

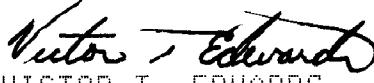

I am one of your Arcadian subscribers. Yesterday I spoke with you about the fate of the ZGRASS addition. Needless to say your words brought hope to me once again. I have talked with Mr. Walter Pertaining to ZGRASS and he remains very excited!

As I said, I had planned on doing some really serious ZGRASS programming while in Korea. Currently I am working (on and off) on a conversion of a TRS-80 Color Computer program about a nuclear power plant simulation. Actually it was written for an Apple II and published in Creative Computing about 2 years ago. The additions I made were graphics and some information format displays. It seems to be the least difficult program to convert.

Enclosed with this letter is a conversion of a program I saw published in the Arcadian. The program part that dealt with the lunar lander was enhanced and updated (through Blue Ram Extended BASIC) to be a simple program of earning point score based on the amount of fuel left after landing. I hope the subscribers enjoy it and I further hope it will simulate enhanced version even beyond my concept.

I will be departing in January 1984. If ZGRASS comes to pass, I remain an eager customer. It may be a while before I answer, but please have patience. My wife will forwarding my mail to me from Oklahoma to Korea. Once again Mr. Fabris, best wishes to you and your family over the holidays. Let's hope 1984 will truly be the year of ZGRASS!!!!!!

Sincerely,

  
VICTOR T. EDWARDS

P.S. To my knowledge, the Air Force and I plan to do Korea for only one year. My wife couldn't stand anything longer.

## LUNAR LANDER PROGRAM

This program is an enhancement of an original program published as part of the one and only cassette based program released by Bally Manufacturing included with the 300 baud tape interface.

The scenario is as follows: You are the command pilot of a lunar landing module currently descending to the surface of an unnamed planet. The readout at the top of the screen gives you the current fuel state, altitude and descent velocity. Pulling the trigger will activate retro-rockets and decrease your descent velocity. You must land with a descent velocity of 6 or less, or there will be an explosion. This program is written in Extended Blue Ram BASIC and can run in just 4K memory. It presents an improvement over Bally or Astro BASIC plus an opportunity for further program enhancement. Enjoy.
